#### **SPECIFICATIONS**

Product Description	Designed for use with hoisting equipment, MRT4-DC lifters support loads using vacuum and manipulate loads using manual 360° rotation and manual 90° tilt motions.		
Model Number	MRT49DC	MRT411LDC	
Vacuum Pads (4 each, standard rubber <sup>1</sup> )	9" [23 cm] nominal diameter 11" [28 cm] nominal diameter, lipped (Model VPFS9) (Model G3370)		
Pad Spread <sup>2</sup>	(to outer	edges)	
Length — Maximum	75¼" [192 cm]	78¼" [199 cm]	
Length — Minimum	29¾" [76 cm]	32¾" [83 cm]	
Width — Maximum	46½" [119 cm]	49½" [126 cm]	
Width — Minimum	12¾" [33 cm]	15¾" [40 cm]	
Maximum Load Capacity <sup>3</sup>	Per pad: 125 lbs [56.5 kg] Total: 500 lbs [225 kg]	Per pad: 175 lbs [80 kg] Total: 700 lbs [320 kg]	
Lifter Weight	135 lbs [62 kg]		
Power Source	12 volts DC, 3.5 amps		
Battery Capacity	7 amp-hours		
Rotation Capability	Manual, 360°, with latching at each ¼ turn (when required)		
Tilt Capability	Manual, 90°, with automatic locking in vertical position		
Product Options	Available with Individual Pad Shutoffs. See separate instructions about other options.		
Operating Elevation	Up to 6,000' [1,828 m]		
Operating Temperatures	32° — 104° F [0° — 40° C]		
Service Life	20,000 lifting cycles, when used and maintained as intended <sup>4</sup>		
ASME Standard BTH-1	Design Category "B", Service Class "0"		
Troubleshooting Guide	TST-011_MRT4DC-SVS_rev_2013-049		

<sup>1.....</sup> Available with other rubber compounds for special purposes.

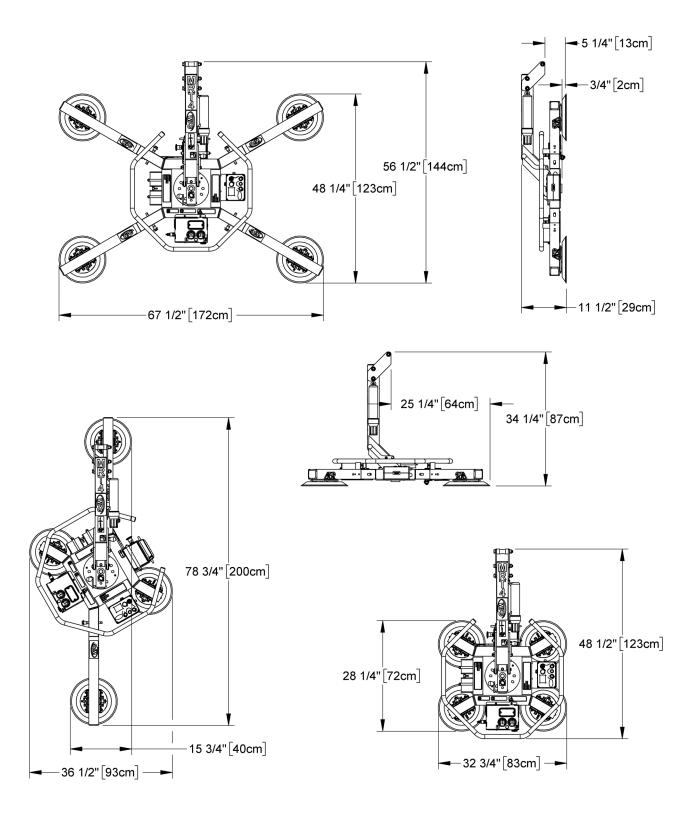

MRT4-DC: #35070 3 Rev 30.1/1-24

<sup>2.....</sup> The illustrations under "To Change the Pad Frame Configuration" show the Pad Spread for all approved MRT411LDC(3) pad frame configurations.

<sup>3.....</sup> The Maximum Load Capacity is rated at a vacuum of 16" Hg [-54 kPa] on clean, smooth, nonporous flat surfaces with a friction coefficient of 1. Pad compound, load rigidity, strength, surface conditions, overhang, angle, center of gravity and temperature can also affect the lifting capacity. A "qualified person" should evaluate the effective lifting capacity for each use (see definition under "Rated Load Test").

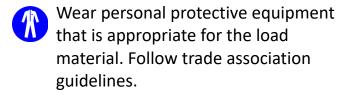

<sup>4.....</sup> Vacuum pads, filter elements and other wear-out items are excluded.

#### **SPECIFICATIONS**

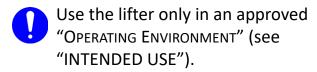

Note: MRT411LDC dimensions are identical to the MRT411LDC3 shown on this page.

#### SAFETY

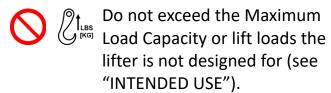

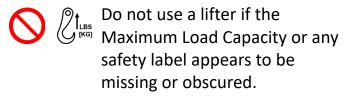

- Make sure to consider all possible effects of "INDIRECT LOADING" on lifting capacity (see "INTENDED USE").
- Do not use a lifter that is damaged, malfunctioning, or missing parts.
- Do not use a lifter if the sealing edge of any vacuum pad is cut or otherwise damaged.
- O not use a lifter to lift cracked or broken glass.

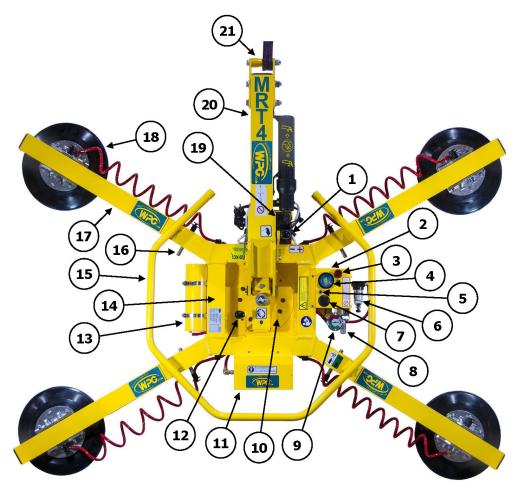

- Make sure the contact surfaces of the load and vacuum pads are clean before attaching the lifter (see "MAINTENANCE").
- Position the vacuum pads correctly on the load before lifting (see "OPERATION").
- Do not lift a load if any vacuum indicator shows inadequate vacuum.
- Keep unauthorized personnel away from the lifter, to avoid injury in case of an unintended load release.
- Do not touch the vacuum release controls during a lift.
- Do not allow people to ride on the lifter or the load.
- Do not lift a load higher than necessary or leave suspended loads unattended.
- Do not position a loaded or unloaded lifter over people.
- Before servicing a powered lifter, place the power control in the inactive position and, when possible, disconnect the power source.

#### **OPERATING FEATURES**

Features shown here are <u>underlined</u> on their first appearance in each section following.

- 1 TILT RELEASE LEVER
- 4 BATTERY GAUGE
- 7 LOW VACUUM WARNING BUZZER (optional)
- 10 ROTATION WEAR PLATE
- 13 VACUUM RESERVE TANK
- 16 COTTERLESS HITCH PIN
- 19 BATTERY

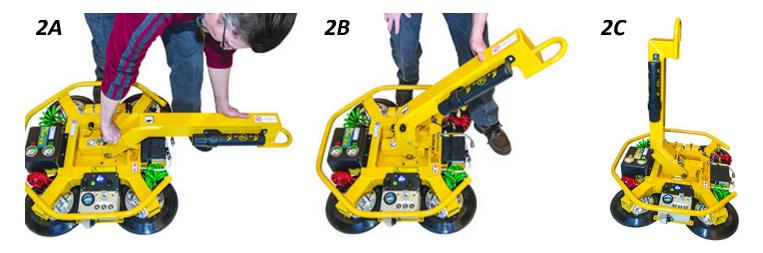

Not shown: BATTERY CHARGER

- 2 Enclosure w/ VACUUM SWITCH
- 5 BATTERY TEST BUTTON
- 8 VALVE HANDLE
- 11 Cover for VACUUM PUMP
- 14 PAD FRAME
- 17 EXTENSION ARM
- 20 LIFT BAR

- 3 LOW VACUUM WARNING LIGHT
- 6 AIR FILTER
- 9 VACUUM GAUGE
- 12 ROTATION RELEASE LEVER
- 15 CONTROL HANDLE
- 18 VACUUM PAD w/ MOVABLE PAD MOUNT
- 21 LIFT POINT

Note: A standard MRT411LDC is shown. Although some of the following photos do not show this specific lifter, they all illustrate how this kind of lifter functions.

For information about specific parts, see "REPLACEMENT PARTS" and/or any separate instructions for Product Options.

- 1) Remove all shipping materials and save them with the shipping container for future use.
- 2) Suspend the lifter from appropriate hoisting equipment:
  - 2.1) Select a crane and/or hoist rated for the Maximum Load Capacity plus the Lifter Weight.

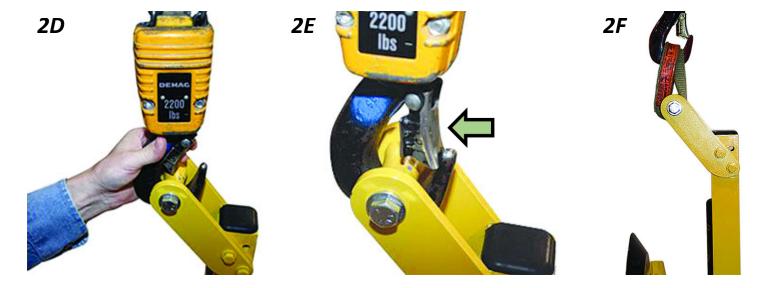

Note: Any lifter use must comply with all statutory or regulatory standards for hoisting equipment in your region.

- 2.2) Disengage any tilt locks or latches, and raise the lift bar (figs. 2A-C).
- 2.3) Attach the hoisting hook to the <u>lift</u> point (figs. 2D-E).

Note: Use rigging (fig. 2F) as needed to make sure the hook does not interfere with the load.

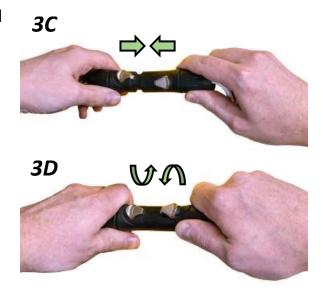

- Only use rigging rated for Maximum Load Capacity plus Lifter Weight.
- Make sure hook has restraining latch (see arrow in fig. 2E).

2.4) Use the hoisting equipment to remove the lifter from the shipping container. Avoid damaging the <u>vacuum pads</u>.

3) Connect the electrical connectors (figs. 3A-B and figs. 3C-D).

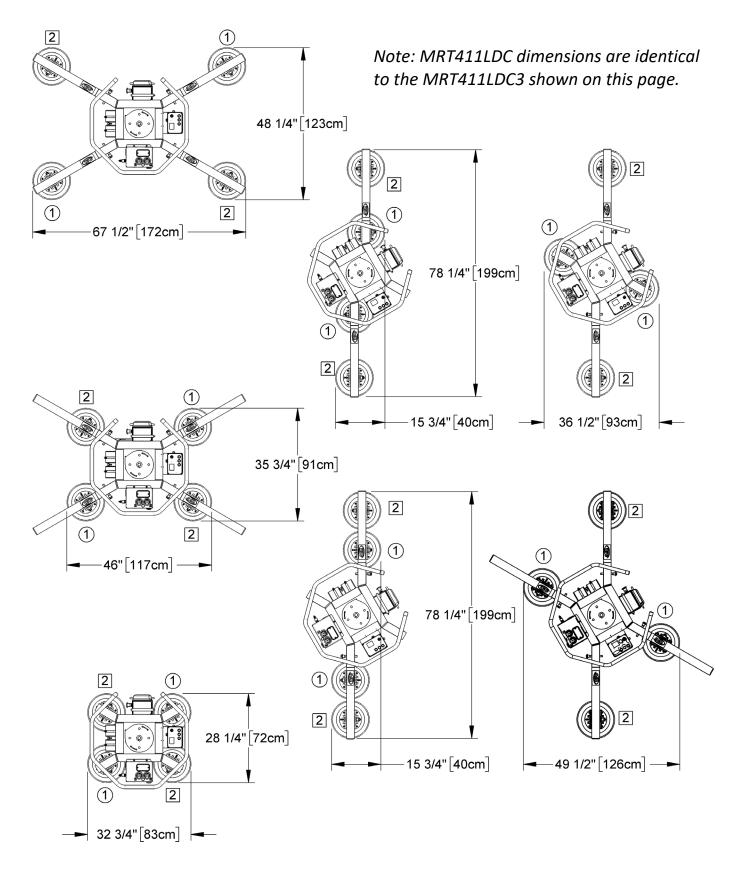

4) Assemble the <u>pad frame</u> for optimal load support (see "To Change the Pad Frame Configuration"). Remove the pad covers (fig. 4A) and save them for future use.

5) Perform tests as required under "Testing".

#### TO CHANGE THE PAD FRAME CONFIGURATION

Various <u>pad frame</u> configurations enable the lifter to match different load dimensions. The illustrations on the preceding page show all approved configurations. Dimensions show Pad Spreads for a standard MRT411LDC lifter (see "SPECIFICATIONS" for other models).

- Choose an approved configuration to maximize support across the load surface and to minimize load overhang (see "LOAD CHARACTERISTICS").
- Use only approved pad frame configurations.
- 0

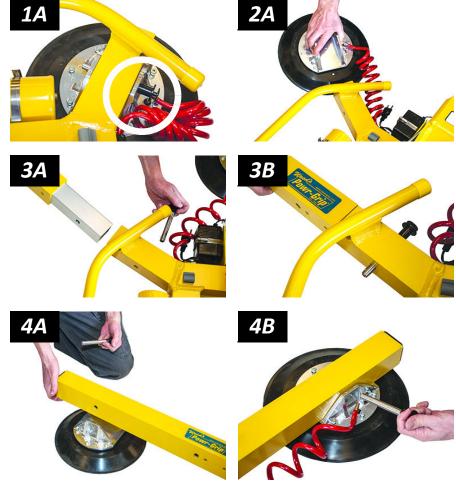

Securely position vacuum hoses to avoid damage during lifter operation.

2) Install or remove the <u>extension arms</u> and reposition the <u>movable pad mounts</u> as needed.

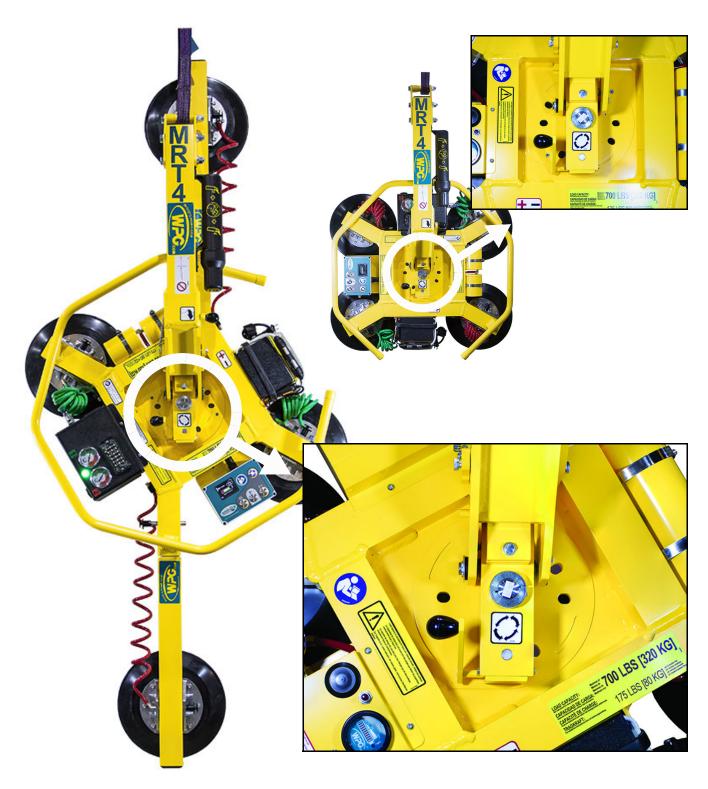

#### **Installing/Removing Extension Arms and Repositioning Vacuum Pads**

- Remove the cotterless hitch pin (circled in fig. 1A) that secures the movable pad mount to the pad frame.
- 2) Remove the <u>vacuum pad</u> from the pad frame (fig. 2A).
- 3) Insert the <u>extension arm</u> into the pad frame (fig. 3A). Then insert a cotterless hitch pin to secure it (fig. 3B).
- 4) Position the movable pad mount on the extension arm (fig. 4A). Then insert a cotterless hitch pin to secure it (fig. 4B).

Notes: Repeat or reverse these steps to configure the pad frame as needed. Store removed components in a clean, dry location.

#### **Using Secondary Rotation Stops**

Align the secondary rotation stops for correct use of the <u>pad frame</u> in long, narrow configurations.

#### INTENDED USE

#### **LOAD CHARACTERISTICS**

Make sure the vacuum lifter is intended to handle each load according to these requirements:

Do NOT lift explosives, radioactive substances or other hazardous materials.

- The load weight must not exceed the Maximum Load Capacity.
- The load must be a single piece of relatively nonporous material with a flat and relatively smooth contact surface.<sup>1, 2</sup> To determine whether the load is too porous or rough, perform the "Lifter/Load Compatibility Test".
- The load's contact surface must be able to obtain a friction coefficient of 1 with the lifter's vacuum pads (see "Pad-to-Load Friction Coefficient"). Otherwise, the capacity should be derated appropriately.
- The load's surface temperature must not exceed the Operating Temperatures.<sup>3</sup>

- The load's *minimum* length and width are determined by the current Pad Spread (see "SPECIFICATIONS").
- The load's maximum length and width are determined by its allowable overhang.<sup>4</sup>
- 1" [2.5 cm] is the allowable thickness at Maximum Load Capacity.<sup>5</sup>

Note: Standard vacuum pads can stain or deform load surfaces with light colors or soft coatings. Test such surfaces for damaging effects before using the lifter on them.<sup>6</sup>

Rev 30.1/1-24 12 MRT4-DC: #35070

<sup>1.....</sup> Although concave vacuum pads can also attach to some curved loads, curvature can reduce lifting capacity. Contact WPG for more information.

<sup>2.....</sup> A "single piece" of material includes curtainwall assemblies, unitized glazing systems and similar construction units.

<sup>3.....</sup> Vacuum pads made from a heat-resistant rubber compound can enable you to lift loads with higher surface temperatures. Contact WPG or an authorized dealer for more information.

<sup>4.....</sup> The allowable overhang is the amount of load material that can extend sideways beyond the vacuum pads without breaking or otherwise being damaged. This depends on the load material, its thickness, and the angle of handling (if any). Since every material has different physical properties, the allowable overhang must be evaluated separately for each load type. Contact WPG or an authorized dealer for more information.

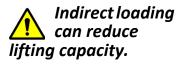

<sup>5.....</sup> However, the allowable thickness increases as load weight decreases. Contact WPG for more information.

<sup>6.....</sup> Alternative rubber compounds are available for these purposes. Contact WPG or an authorized dealer for more information.

#### INTENDED USE

#### **INDIRECT LOADING**

Make sure to account for dynamic loading or other inadvertent loading that can negatively affect lifting capacity, such as:

- Weight amplification that results when a loaded vacuum lifter abruptly starts/stops moving, changes direction or bounces up and down (eg, when a telehandler transports a loaded lifter across rough terrain).
- External force that effectively increases the weight of a lifter's attached load (eg, when a load of sheet material reacts to wind gusts).

#### **OPERATING ENVIRONMENT**

Make sure the lifter is suitable for each work environment, given the following restrictions:

 This lifter is not intended for any environment that is dangerous to the operator or damaging to the lifter. Avoid environments containing explosives, caustic chemicals and other dangerous substances.

Metal particles and similar environmental contaminants could result in <u>vacuum pump</u> failure.

 The work environment is limited by the Operating Elevation and Operating Temperatures.<sup>1, 2</sup>

• The lifter is not designed to be watertight. Do not use it in rain or other unsuitable conditions.

**CE/UKCA** — A secondary positive holding device is required to lift loads on construction sites.

#### DISPOSAL OF THE LIFTER

After the Service Life of the lifter has ended (see "SPECIFICATIONS"), dispose of it in compliance with all local codes and applicable regulatory standards.

Note: Special disposal regulations may apply to the battery.

MRT4-DC: #35070 13 Rev 30.1/1-24

<sup>1.....</sup> Although lifter use may be possible at higher elevation, lifting capacity is reduced whenever the lifter is unable to attain vacuum in the green range on the vacuum gauge. Contact WPG for more information.

<sup>2....</sup> Special provisions may allow the lifter to operate outside the specified temperature range. Contact WPG for more information.

#### BEFORE USING THE LIFTER

Determine whether the vacuum lifter is capable of each intended task (see "SPECIFICATIONS" and "INTENDED USE"). Then complete the following preparations:

#### **Taking Safety Precautions**

 Be trained in all industry and regulatory standards for lifter operation in your region.

Read all directions and safety rules before using lifter.

Always wear appropriate personal protective equipment.

 Follow trade association guidelines about precautions needed for each load material.

#### **Performing Inspections and Tests**

- Follow the "INSPECTION SCHEDULE" and "TESTING".
- Service the <u>air filter</u> whenever its bowl contains liquid or other contaminates, or its element appears dirty (see "AIR FILTER MAINTENANCE" in SERVICE MANUAL).

Examine air filter regularly and service when needed.

 If the lifter has a <u>low vacuum warning buzzer</u> (fig. 1A), make sure it is clearly audible at the maximum distance between the operator and the lifter, despite any barriers or obstacles.<sup>1, 2</sup>

Make sure warning buzzer can be heard over noise at operator position.

Rev 30.1/1-24 14 MRT4-DC: #35070

<sup>1.....</sup> Maximum buzzer volume is 103 dBA at 2' [60 cm]. If CE or UKCA Standards apply, consult EN 7731 to make sure the warning buzzer is compliant.

<sup>2.....</sup> The "Vacuum Test" provides a convenient opportunity to check this.

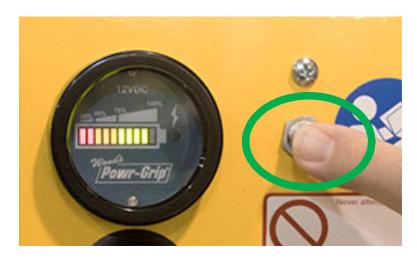

#### **Checking the Battery**

Always check <u>battery</u> energy before every lift.

Use the <u>battery gauge</u> to determine whether the battery needs to be charged (see "BATTERY RECHARGE").<sup>1</sup> Never use the lifter unless battery energy appears in the green range.

- While the <u>valve handle</u> is in the "attach" position ( ↓← / power on), the battery gauge automatically shows battery energy.<sup>2</sup>
- While the valve handle is in the "release" position ( |→ / power off), use the <u>battery test button</u> (circled) to check the battery energy.<sup>3</sup>

MRT4-DC: #35070 15 Rev 30.1/1-24

<sup>1.....</sup> If the vacuum pump is running or the battery charger is connected to an AC power source, the battery gauge will shown an inaccurate energy level.

<sup>2.....</sup> After the pump stops running, the battery gauge requires a few moments to stabilize before it shows an accurate energy level.

<sup>3.....</sup> If the lifter has not been used since the battery was charged, the battery gauge may falsely show a high energy level. This "surface charge" dissipates after the pump runs for about 1 minute, allowing the gauge to show accurate energy.

#### To Use the Optional Pad Shutoffs

Each <u>pad shutoff</u> on the <u>pad frame</u> controls the vacuum line to the adjacent <u>vacuum pad</u>. Activating or deactivating the airflow at specific pads enables the lifter to handle loads with different weights and dimensions (see "SPECIFICATIONS") or to avoid holes in the load surface.

To support the maximum load weight and larger load dimensions, all pads must be activated; for smaller weights and dimensions, some pads may be deactivated, *provided* that the lifter still has sufficient capacity to support the load (see "LOAD CHARACTERISTICS").

Closing any pad shutoff reduces lifting capacity.

To activate a pad, open the shutoff valve (ie, place lever *parallel* with vacuum line — fig. 1A).

To deactivate a pad, close the shutoff valve (ie, place lever perpendicular to vacuum line — fig. 1B).

To calculate the lifting capacity when some pads are deactivated, consult the Per-Pad Load Capacity and multiply by the number of pads currently activated. Always activate pads in a symmetrical configuration and use as many pads as possible for each load being lifted, to maximize lifting capacity and to minimize load overhang.

Rev 30.1/1-24 16 MRT4-DC: #35070

#### TO ATTACH THE PADS TO A LOAD

Make sure the contact surfaces of the load and <u>vacuum pads</u> are clean (see "Pad Cleaning").

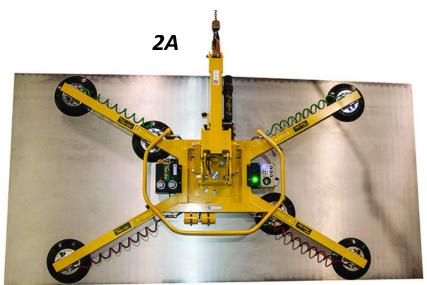

#### Positioning the Lifter on the Load

1) Center the <u>pad frame</u> on the load (fig. 1A).<sup>1</sup>

- 2) Make sure all <u>vacuum pads</u> will fit on the load and will be loaded evenly (fig. 2A).
  - Consult the Per-Pad Load Capacity.
- 3) Place the vacuum pads in contact with the load surface.

<sup>1.....</sup> The lifter is designed to handle the maximum load weight when the load's center of gravity is positioned within 2" [5 cm] of the lifter's rotation axis. Uncentered loads may rotate or tilt unexpectedly (as applicable).

#### Sealing the Pads on the Load

 Pull the <u>valve handle</u> outward *until it latches* (circled in fig. 1A) in the "attach" position ( ↓← ).

Keep valve handle in "attach" position throughout lift.

The <u>vacuum pump</u> will turn on, the <u>low vacuum</u> warning light will remain lit and the <u>low vacuum warning buzzer</u>, if present, will sound until the <u>vacuum pads</u> seal. This is normal.

2) Press the lifter firmly against the load to help the pads begin to seal. 1

#### **Reading the Vacuum Gauge**

A <u>vacuum gauge</u> shows the current vacuum level in positive inches of Hg and negative kPa:

- Green range (≥16" Hg [≤-54 kPa]):
   Vacuum level is sufficient to lift the maximum load weight (fig. 1B).
- Red range (<16" Hg [> -54 kPa]):
   Vacuum level is not sufficient to lift the maximum load weight (fig. 1C).

If it takes more than 5 seconds for the vacuum level to reach 5" Hg [-17 kPa], press on any <u>vacuum pad</u> that has not yet sealed.

Once the pads have sealed, the lifter should be able to maintain sufficient vacuum for lifting, except when used above the maximum Operating Elevation.<sup>2</sup> If it does not:

- Make sure the <u>vacuum switch</u> is adjusted correctly (see <u>SERVICE MANUAL</u>).
- When necessary, perform the "Vacuum Test".

Rev 30.1/1-24 18 MRT4-DC: #35070

<sup>1.....</sup> Although a vacuum pad may become distorted during shipping or storage, this condition should correct itself with continued use.

<sup>2.....</sup> If the lifter is used above the maximum Operating Elevation (see "SPECIFICATIONS"), it may not be able to maintain sufficient vacuum for lifting.

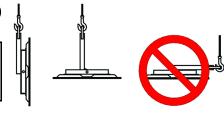

Contact WPG for more information.

#### NPFRATINN

#### TO LIFT AND MOVE THE LOAD

<u>Lift bar</u> must be vertical to lift

#### **Interpreting the Warning Light and Optional Warning Buzzer**

When vacuum is sufficient to lift the Maximum Load Capacity,

Never lift load unless warning devices turn off, because this could result in load release and personal injury.

the vacuum pump and the low vacuum warning light turn off temporarily, to conserve battery energy.

When air leaks into the vacuum system, the vacuum pump turns on and off (along with the warning light) as necessary to maintain sufficient vacuum for lifting. Note: The low vacuum warning buzzer, if present, turns on and off together with the warning light.

#### **Monitoring Vacuum Indicators**

Monitor the low vacuum warning light and the vacuum gauge (fig. 1A) throughout the entire lift.

Make sure vacuum indicators remain completely visible.

If the warning light turns on and the vacuum gauge shows a level less than 16" Hg [greater than -54 kPa]:

1) Keep everyone away from a suspended load until it can be safely lowered to a stable support.

Stay clear of any suspended load while indicators warn of low vacuum.

- 2) Stop using the lifter until the cause of the vacuum loss can be identified: Conduct the "Pad Inspection" and perform the "Vacuum Test".
- 3) Correct any faults before resuming normal operation of the lifter.

#### **Controlling the Lifter and Load**

When the lifter is ready, use the hoisting equipment to raise the lifter and load as needed.

Use a <u>control handle</u> (circled in fig. 1A) to keep the lifter and load in the required position.

Once there is enough clearance, you may move the load as required.

Never allow any pad shutoff to be opened or closed while lifting, because this could result in a load release and personal injury.

#### In Case of a Power Failure

A <u>vacuum reserve tank</u> helps maintain vacuum temporarily in the event of a <u>battery</u> failure or electrical system failure. Although the lifter is designed to support the load for at least 5 minutes without power, this depends on many factors, including the "LOAD CHARACTERISTICS" and the condition of the <u>vacuum pads</u> (see "VACUUM PAD MAINTENANCE").

If a power failure occurs, keep everyone away from a suspended load until it can be safely lowered to a stable support. Correct any faults before resuming normal operation of the lifter.

Stay clear of any suspended load during power failure.

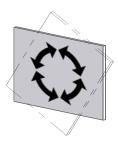

#### TO ROTATE THE LOAD

Make sure load is positioned correctly on lifter (as previously directed).

Never disengage rotation and tilt latches at the same time, because this could result in load damage or personal injury.

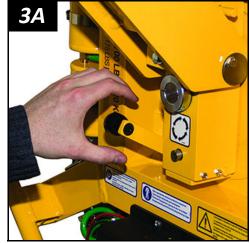

- Make sure the load has enough clearance to rotate without contacting anyone or anything.
- 2) Use the <u>control handle</u> (circled in fig. 2A) to keep the load under control at all times.

Unbalanced loads may rotate unexpectedly when rotation latch is disengaged.

- 3) Pull the <u>rotation release</u> <u>lever</u> (fig. 3A) to disengage the rotation latch, and rotate the load as required.
- 4) To stop load motion, let go of the rotation release lever and guide the load to the next stop.

Note: Whenever rotation is not required, keep the rotation latch engaged, to prevent load damage or personal injury.

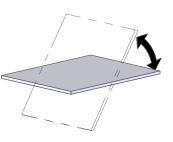

#### TO TILT THE LOAD

Make sure load is positioned correctly on lifter (as previously directed).

Never disengage rotation and tilt latches at the same time, because this could result in load damage or personal injury.

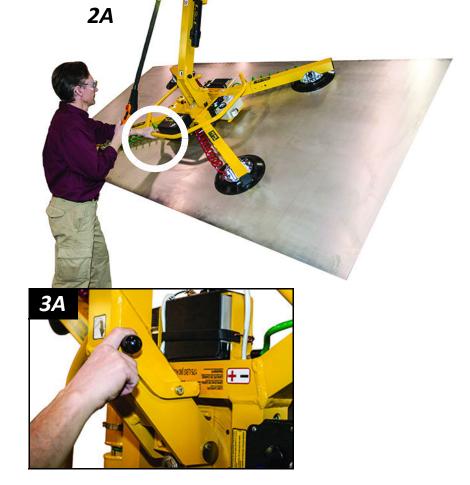

- Make sure the load has enough clearance to tilt without contacting anyone or anything.
- Use the <u>control handle</u> (circled in fig. 2A) to keep the load under control at all times.

Unbalanced loads may tilt unexpectedly when tilt latch is disengaged.

3) If the <u>pad frame</u> is latched, pull the <u>tilt release lever</u> (fig. 3A) to disengage the tilt latch.

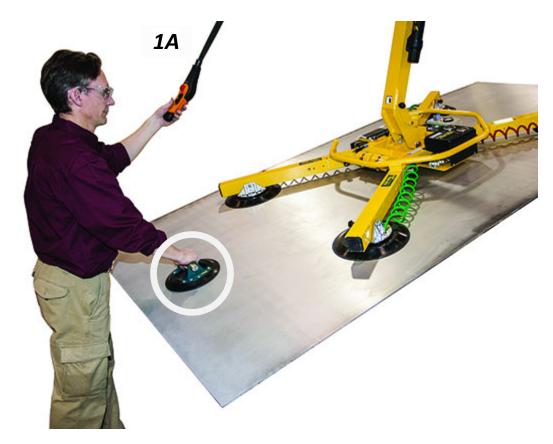

Note: The pad frame automatically latches when tilted to the vertical position.

4) Tilt the load as required.

Note: See "LOAD CHARACTERISTICS" about allowable load overhang.

A load with overhang may force you to release the control handle as the load approaches the flat position. In this case, use hand cups (circled in fig. 1A) or other appropriate means to control the load.

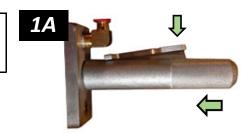

#### TO RELEASE THE PADS FROM THE LOAD

Make sure load is at rest and fully supported before releasing <u>vacuum pads</u>.

1) Press the lever to release the latch and push the <u>valve</u> <u>handle</u> inward (fig. 1A) to the "release" position (→).

Do not move lifter until pad releasespads release completely, because such movement could result in load damage or personal injury.

2) Before you lift another load, perform the Every-Lift Inspection (see "INSPECTION SCHEDULE").

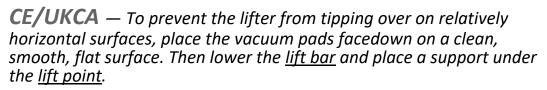

#### **AFTER USING THE LIFTER**

- 1) Leave the <u>valve handle</u> in the "release" position ( $|\rightarrow|$  / power off).
- 2) Charge the <u>battery</u> after each workday as needed (see "BATTERY RECHARGE").<sup>1</sup>
- 3) Use the hoisting equipment to lower the vacuum lifter gently onto a stable support. Then detach the hoisting hook from the <u>lift point</u>.

Caution: Do not set the lifter on surfaces that could soil or damage vacuum pads.

#### **Storing the Lifter**

1) Use the pad covers supplied (fig. 1B) to keep the <u>vacuum pads</u> clean.

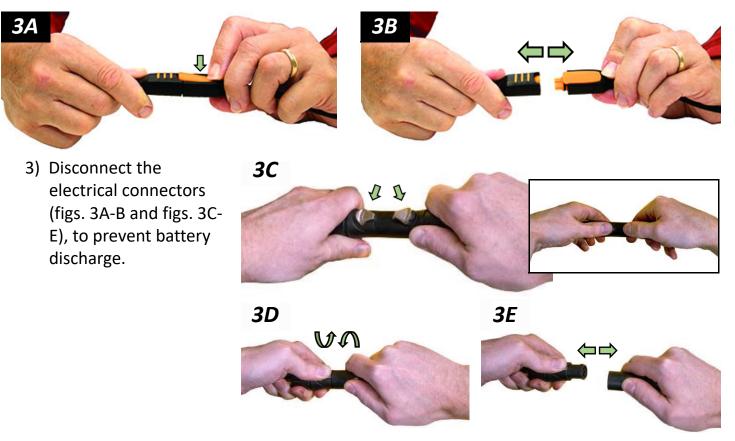

2) Charge the <u>battery</u> completely and repeat every 6 months (see "BATTERY RECHARGE").

Rev 30.1/1-24 24 MRT4-DC: #35070

<sup>1.....</sup> To maximize battery life, charge it promptly after each use.

4) Store the lifter in a clean, dry location. Store the battery between 32° and 70° F [0-21° C]. Avoid storage above 100° F [38° C].

#### **Transporting the Lifter**

Secure the lifter in the original shipping container with the original shipping materials or equivalent.

#### **INSPECTION SCHEDULE**

Perform inspections according to the following frequency schedule. If any fault is found, correct it and perform the next most frequent inspection before using the vacuum lifter.

Note: If a lifter is used less than 1 day in a 2-week period, perform the Periodic Inspection before using it.

Action	Every Lift	Frequent <sup>1</sup> (every 20-40 hrs)	Periodic <sup>2</sup> (every 250-400 hrs)
Examine <u>vacuum pads</u> for contaminates or damage (see "Pad Inspection").	✓	✓	✓
Examine load surface for contaminates or debris.	✓	✓	✓
Examine controls and indicators for damage.	✓	✓	✓
Check <u>battery</u> for adequate charge (see "Checking the Battery").	✓	✓	✓
Examine lifter's structure for damage.		✓	✓
Examine vacuum system for damage (including <u>vacuum</u> <u>pads</u> , fittings and hoses).		✓	✓
Examine <u>air filter</u> for conditions requiring service (see "AIR FILTER MAINTENANCE" in <u>SERVICE MANUAL</u> ).		✓	✓
Perform "Vacuum Test".		✓	✓
Check for unusual vibrations or noises while operating lifter.		✓	✓
<ul> <li>Examine entire lifter for evidence of:</li> <li>looseness, excessive wear or excessive corrosion</li> <li>deformation, cracks, dents to structural or functional components</li> <li>cuts in vacuum pads or hoses</li> <li>any other hazardous conditions</li> </ul>			<b>✓</b>
Inspect entire electrical system for damage, wear or contamination that could be hazardous, in compliance with all local codes and regulatory standards.  Caution: Use appropriate cleaning methods for each electrical part, as specified by codes and standards. Improper cleaning can damage parts.			<b>✓</b>

<sup>1.....</sup> The Frequent Inspection is also required whenever the lifter has been out of service for 1 month or more.

<sup>2.....</sup> The Periodic Inspection is also required whenever the lifter has been out of service for 1 year or more. Keep a written record of all Periodic Inspections. If necessary, return the lifter to WPG or an authorized dealer for repair (see "REGISTRATION AND LIMITED WARRANTY").

#### **TESTING**

Perform the following test to determine whether or not a load surface is too porous or rough:

#### Lifter/Load Compatibility Test<sup>1</sup>

- 1) Make sure the vacuum generating system is functioning correctly (see "Vacuum Test").
- 2) Clean the load surface and the vacuum pads (see "Pad Cleaning").<sup>2</sup>
- 3) Place the load in the upright position on a stable support.
- 4) Attach the vacuum pads to the load as previously directed.
- 5) After the <u>vacuum pump</u> stops running, disconnect the <u>battery</u> connector (see "AFTER USING THE LIFTER").<sup>3</sup>
- 6) Raise the load a minimal distance, to make sure it is supported by the lifter.

- 7) Watch the <u>vacuum gauge</u>: **Starting from a vacuum level of 16" Hg [-54 kPa], the lifter must maintain a vacuum level greater than 12" Hg [less than -41 kPa] for 5 minutes.** If not, lifting this load requires additional precautions (eg, a load sling). Contact WPG for more information.
- 8) Lower the load *after* 5 minutes or *before* the vacuum level diminishes to 12" Hg [increases to -41 kPa].

.

<sup>1.....</sup> The "Pad-to-Load Friction Coefficient" can affect the outcome of this test.

<sup>2.....</sup> Contaminated loads can cause the vacuum pump to run frequently or continuously. Since excessive pumping quickly reduces battery energy, clean the load whenever possible.

<sup>3.....</sup> Move the valve handle to the "release" position (power off) before reconnecting the battery.

<sup>4.....</sup> Under CE and UKCA requirements, the lifter must maintain a vacuum level greater than 8" [less than -27 kPa].

Perform the following tests before placing the lifter in service *initially, following any repair,* when directed in the "INSPECTION SCHEDULE", or whenever necessary:

#### **Operational Tests**

Test all features and functions of the lifter (see "OPERATING FEATURES" and "OPERATION").

#### **Vacuum Test**

- Clean the face of each <u>vacuum pad</u> (see "Pad Cleaning").
- 2) Use a test load with weight equal to the Maximum Load Capacity, a clean, smooth, nonporous surface and other appropriate "LOAD CHARACTERISTICS". 1

- 3) Attach the lifter to the test load as previously directed. After the <u>vacuum pump</u> stops running, the vacuum level should appear in the green range on the <u>vacuum gauge</u> (if not, see "Vacuum Switch Adjustment" in <u>SERVICE MANUAL</u>).
- 4) Raise the load a minimal distance and disconnect the <u>battery</u> connector (see "AFTER USING THE LIFTER").<sup>2</sup>

- 5) Watch the vacuum gauge: The vacuum level should not decrease by more than 4" Hg [-14 kPa] in 5 minutes.
- 6) Lower the load after 5 minutes or whenever a lifter fails the test, and release the load as previously directed.

7) Qualified service personnel must correct any fault in the vacuum system before the lifter can be returned to service.

This service must be performed by qualified service personnel.

Rev 30.1/1-24 28 MRT4-DC: #35070

<sup>1.....</sup> The load should have either a flat surface or no more curvature than the lifter is designed for, if any.

<sup>2.....</sup> Move the valve handle to the "release" position (power off) before reconnecting the battery.

#### Rated Load Test<sup>1</sup>

The following steps must be performed or supervised by a qualified person:<sup>2</sup>

1) Use a test load that weighs 125% (± 5%) of the Maximum Load Capacity and has the appropriate "LOAD CHARACTERISTICS".

- 2) Attach the vacuum pads to the load as previously directed.
- 3) Position the load to produce the greatest stress on the lifter consistent with "INTENDED USE".
- 4) Raise the load a minimal distance and leave it suspended for 2 minutes.

- 5) Once the test is completed, lower and release the load as previously directed.
- 6) Inspect the lifter for any stress damage, and repair or replace components as necessary to successfully pass the test.

7) Prepare a written report of the test and keep it on file.

MRT4-DC: #35070 29 Rev 30.1/1-24

<sup>1.....</sup> An equivalent simulation may also be used. Contact WPG for more information.

<sup>2.....</sup> A "qualified person" has successfully demonstrated the ability to solve problems relating to the subject matter and work, either by possessing a recognized degree in an applicable field or a certificate of professional standing, or by possessing extensive knowledge, training and experience.

#### MAINTENANCE

Note: Refer to **SERVICE MANUAL #36110** when applicable.

#### VACUUM PAD MAINTENANCE

#### **Pad-to-Load Friction Coefficient**

The friction coefficient represents the lifter's ability to resist load slippage. The Maximum Load Capacity is based on a friction coefficient of 1, as determined by testing of clean, new, standard rubber vacuum pads on clean, dry, regular glass. If the lifter is used under any other conditions, a qualified person must first determine the effective lifting capacity.<sup>1</sup>

Long-term exposure to heat, chemicals or UV light can damage vacuum pads. Replace pads every 2 years or more often when necessary.

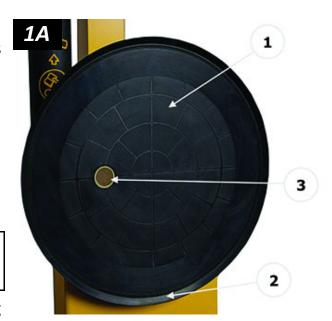

#### **Pad Inspection**

Inspect each <u>vacuum pad</u> (fig. 1A) according to the "INSPECTION SCHEDULE" and correct the following faults before using the lifter (see "REPLACEMENT PARTS", when applicable):

- Contaminants on the face (item 1 in fig. 1A) or sealing edges (item 2 in fig. 1A).
- Filter screen (item 3 in fig. 1A) missing from face.
  - 0

Replace any pad that has damaged sealing edges.

- Nicks, cuts, deformation or abrasions in sealing edges.
- Wear, stiffness or glaze.

Rev 30.1/1-24 30 MRT4-DC: #35070

<sup>1.....</sup> A "qualified person" has successfully demonstrated the ability to solve problems relating to the subject matter and work, either by possessing a recognized degree in an applicable field or a certificate of professional standing, or by possessing extensive knowledge, training and experience.

#### MAINTENANCE

#### **Pad Cleaning**

 Regularly clean the face of each vacuum pad (fig. 1A), using soapy water or other mild cleansers to remove oil, dust and other contaminants.

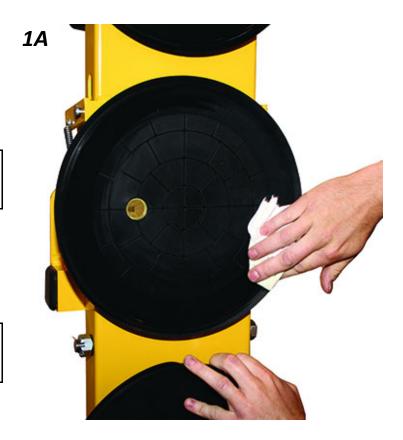

Never use harsh chemicals on vacuum pad.

Solvents, petroleum-based products (including kerosene, gasoline and diesel fuel) or other harsh chemicals can damage vacuum pads.

Never use rubber conditioners on vacuum pad.

Many rubber conditioners can leave a hazardous film on vacuum pads.

- 2) Prevent liquid from entering the vacuum system through the suction hole on the pad face.
- 3) Wipe each pad face clean, using a clean sponge or lint-free cloth to apply the cleanser.<sup>1</sup>
- 4) Allow each pad to dry completely before using the lifter.

MRT4-DC: #35070 31 Rev 30.1/1-24

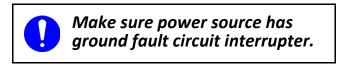

<sup>1.....</sup> A brush with bristles *that do not harm rubber* can help remove contaminants clinging to sealing edges. If these cleaning methods are not successful, contact WPG or an authorized dealer for assistance.

#### MAINTENANCE

#### **BATTERY RECHARGE**

Charge the <u>battery</u> whenever the <u>battery gauge</u> shows reduced energy. <sup>1</sup> *Caution: Make sure* <u>valve handle</u> is in "release" position ( $\rightarrow p$ ) / power off).

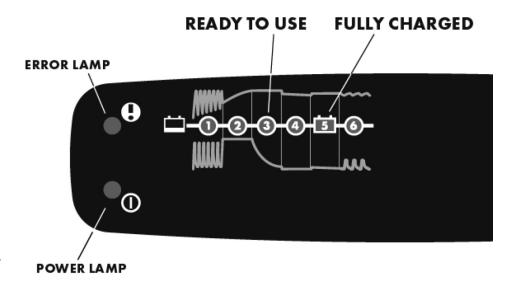

Identify the input voltage marked on the <u>battery</u> <u>charger</u>, and plug it in to an appropriate power source.<sup>2</sup>

The power lamp  $(\Phi)$  turns on when the charger is functioning. Consult the six-stage display to determine the charging status. The battery can be used after stage 3 and is fully charged at stage 5.

Normally, the battery should take no more than 8 hours to charge completely.<sup>3</sup> If not, check for the following faults:

- Power lamp (Φ) flashes: Charger is not connected to battery; reconnect charger (see "ASSEMBLY").
- Error lamp (!) turns on immediately: Battery leads connected to wrong poles; reverse battery leads.
- Charging stops at stage 1 or 4, and error lamp (!) turns on: Battery is no

longer functioning; replace battery (see "REPLACEMENT PARTS").

Before you return the lifter to service, recheck the battery as previously directed.

Rev 30.1/1-24 32 MRT4-DC: #35070

<sup>1.....</sup> To maximize the battery's lifespan, charge it promptly after each use.

<sup>2.....</sup> Any external power supply must conform to all applicable local codes. The lifter is not intended for use while the charger is connected to AC power.

<sup>3.....</sup> The charger automatically reduces the charging rate when the battery is fully charged.

#### REPLACEMENT PARTS

Stock No.	Description	Qty.
93012	Pad Shutoff Valve Assembly (assembly only)	4
93011	Pad Shutoff Valve Assembly (retrofit assembly kit)	4
65441	Vacuum Hose – 0.245" ID x 3/8" OD x 48" Length – Coiled	4
65440	Vacuum Hose – 0.245" ID x 3/8" OD - Red	*
65010	Pad Spring – Coil Type	4
64716	Battery Charger – 0.8 Amp – 240 V AC – Australian Type	1
64715	Battery Charger – 0.8 Amp – 240 V AC	1
64714	Battery Charger – 0.8 Amp – 100 / 120 V AC	1
64664	Battery – 12 V DC – 7 Amp-Hours	1
64283	Bulb – 13 V – Bayonet (for low vacuum warning light)	1
59086NC	Battery Connector – Twin Lead	1
59028	Movable Pad Mount – 2-1/2" Tubing Size	4
54390NC	Power Lead	1
53120	Pad Fitting – Elbow – 3/64" ID	4
53114	Hose Fitting – Coupler – 1/4" Barb	4
49646T	Vacuum Pad – Model G3370 / 11" [28 cm] Diameter – Lipped	4
49506TA	Vacuum Pad – Model VPFS9 / 9" [23 cm] Diameter	4
49180	End Plug – 3" x 3" x 1/4" Tubing Size	1
49150	End Plug – 2-1/2" x 2-1/2" x 1/4" Tubing Size	4
36110	Service Manual – 12V DC – 1 SFCM – Single Vacuum System – Manual Valve	1
29353	Pad Cover	4
15792	Tilt or Rotation Release Lever Knob	2
15632	Pad Filter Screen – Small (for VPFS9 pad)	4
15630	Pad Filter Screen – Large (for G3370 pad)	4
13532	Cotterless Hitch Pin – 1/2" x 3-3/8"	8
10900	Shoulder Bolt – Socket Head – 5/16" x 1/2" x 1/4-20 Thread (for mounting pads)	24

<sup>\*</sup>Length as required; sold by the inch (approx. 2.5 cm).

See **SERVICE MANUAL #36110** for additional parts.

Service only with identical replacement parts,

#### REGISTRATION AND LIMITED WARRANTY

#### To Register this WPG Product

Go to the *PRODUCT REGISTRATION* page at wpg.com and complete the form. Registration keeps you advised of important updates and notifications, and simplifies inquiries to WPG regarding your product. Registration is *not* required to activate your Limited Warranty (see next section).

#### **ABOUT THE LIMITED WARRANTY**

Note: Read the WARRANTY RETURN FORM at wpg.com for important details about the Limited Warranty.

Wood's Powr-Grip® (WPG) products are warranted to be free from defects in manufacturing and materials for 1 year from the date of purchase.

If a problem develops during the warranty period, follow the instructions below to obtain warranty service. If inspection shows that the product has a defect, WPG will repair or replace the product without charge.

#### **Obtaining Warranty Service or Repair Service**

**For customers** *in the U.S. and Canada*: Go to the *EXCHANGES*, *REPAIRS*, & *WARRANTIES* page at wpg.com and click the applicable link. Alternatively, you may contact the WPG Technical Service Department (see contact information below).

**For customers** *in all other localities*: Contact the WPG Technical Service Department (see contact information below) or your dealer for assistance.
