# **SPECIFICATIONS**

	Product Description	Designed for use with hoisting equipment, MR4-AIR lifters support loads using vacuum and manipulate loads using 360° rotation motions.		
Model Numbers		MR411LAIR (with standard pad frame)	MR49AIR (with optional Linear Pad Frame)	
	Vacuum Pads (standard rubber <sup>1</sup> )	Four 11" [28 cm] nominal diameter, lipped (Model G3370)	Four 9" [23 cm] nominal diameter (Model VPFS9)	
	Maximum Pad Spread (to outer edges)	24¾" x 24¾" [63 cm x 63 cm] <sup>2</sup>	9½" x 52" [24 cm x 132 cm]	
ERS [KG]	Maximum Load Capacity <sup>3, 4</sup>	Per pad: 175 lbs [80 kg] Total: 700 lbs [320 kg]	Per pad: 125 lbs [56.5 kg] Total: 500 lbs [225 kg]	
LBS	Lifter Weight	Approx 80 lbs [37 kg]		
	Power Source	Compressed air, 80-150 psi [550-1035 kPa] line pressure, 4 SCFM [113 liters/minute] @ 80 psi [550 kPa]		
C	Rotation Capability	Manual, 360°, with 8 rotation stops (every 45°)		
((1 <b>1</b> √ 31)	Product Options	Available with Linear Pad Frame. See separate instructions about other options.		
FT [m]\	Operating Elevation	Up to 6,000' [1,828 m]		
*F [*C]	Operating Temperatures	32° — 104° F [0° — 40° C]		
	Service Life	16,000 lifting cycles, when used and maintained as intended. <sup>5</sup>		
	ASME Standard BTH-1	Design Category "B", Service Class "0"		
	Troubleshooting Guide	TST-016_GENERIC_LEAK_TEST_rev_2014-086		

- 1..... Available with other rubber compounds for special purposes.
- 2..... Pad Spread changes with rotation of standard pad frame (see page 5).
- 3...... The Maximum Load Capacity is rated and verified at a vacuum of 16" Hg [-54 kPa] on clean, smooth, nonporous flat surfaces with a friction coefficient of 1. Rating is verified by testing on polycarbonate (or metal with a painted surface) with a coefficient of friction similar to plain (non-coated) glass and a surface temperature at approx. 70° F [21° C].
- 4..... Pad compound, load rigidity, strength, surface conditions, overhang, angle, center of gravity and temperature affect lifting capacity. A "qualified person" should evaluate the effective lifting capacity for each use (see definition under "Rated Load Test").
- 5...... Vacuum pads, filter elements and other wear-out items are excluded.

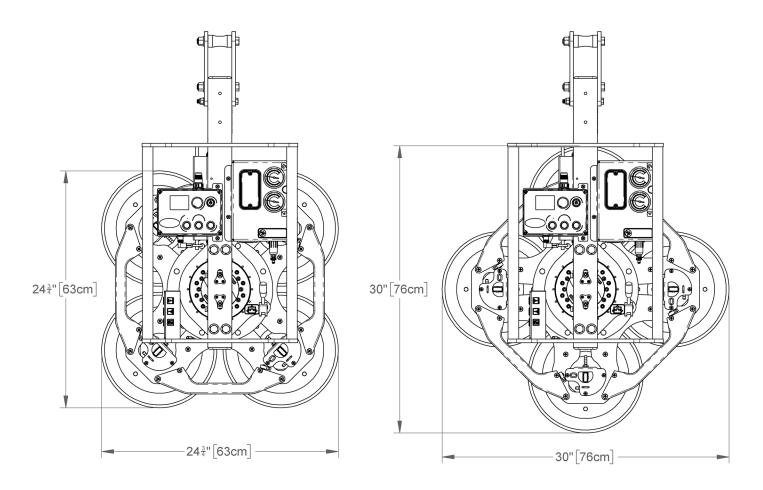

# **SPECIFICATIONS**

Note: Dimensions for an MR411LAC3 with a standard pad frame (top) and an MR49AC3 with the optional Linear Pad Frame (bottom) are shown. Dimensions for MR4-AIR lifters are identical.

# **SPECIFICATIONS**

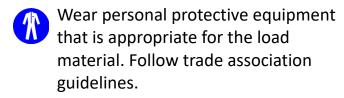

The Pad Spread for an MR411LAIR can be changed simply by rotating the pad frame as shown. Additional adjustments can be made using pad shutoffs (see "To Use Pad Shutoffs"). 2

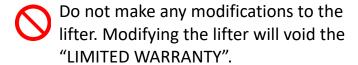

<sup>1.....</sup> An MR411LAC3 is shown. Pad Spread dimensions for an MR411LAIR are identical.

<sup>2.....</sup> The optional Linear Pad Frame also features pad shutoffs.

# SAFFTY

- Use the lifter only in an approved "OPERATING ENVIRONMENT" (see "INTENDED USE").
- Make sure to consider all possible effects of "INDIRECT LOADING" on lifting capacity (see "INTENDED USE").
- Do not use a lifter that is damaged, malfunctioning, or missing parts.
- Do not use a lifter if the sealing edge of any vacuum pad is cut or otherwise damaged.
- Do not use a lifter to lift cracked or broken glass.
- Do not exceed the Maximum Load Capacity or lift loads the lifter is not designed for (see "INTENDED USE").

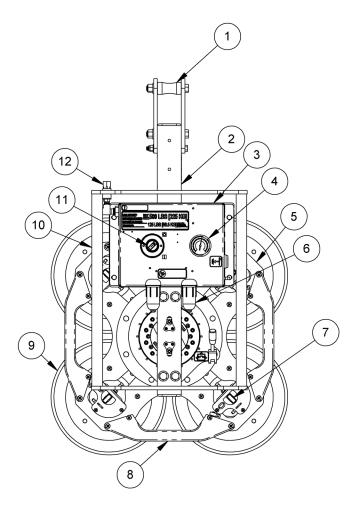

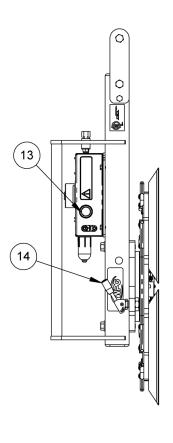

Do not use a lifter if the Maximum Load Capacity or any safety label appears to be missing or obscured.

- Make sure the contact surfaces of the load and vacuum pads are clean before attaching the lifter (see "MAINTENANCE").
- Position the vacuum pads correctly on the load before lifting (see "OPERATION").
- Do not lift a load if any vacuum indicator shows inadequate vacuum.
- Keep unauthorized personnel away from the lifter, to avoid injury in case of an unintended load release.
- Do not touch the vacuum release controls during a lift.
- Do not allow people to ride on the lifter or the load.
- Do not lift a load higher than necessary or leave suspended loads unattended.
- Do not position a loaded or unloaded lifter over people.
- Before servicing a powered lifter, place the power control in the inactive position and, when possible, disconnect the power source.

# **OPERATING FEATURES**

Features shown here are <u>underlined</u> on their first appearance in each section following.

- 1 LIFT POINT
- 4 VACUUM GAUGE
- 7 PAD SHUTOFF
- 10 LIFT BAR CONTROL HANDLE
- 13 "RELEASE" BUTTON

- 2 LIFT BAR
- 5 PAD FRAME
- 8 PAD FRAME CONTROL HANDLE
- 11 AIR SUPPLY SWITCH
- 14 ROTATION RELEASE LEVER

- B Enclosure w/ VACUUM PUMP (venturi)
- 6 AIR FILTER
- 9 VACUUM PAD
- 12 AIR SUPPLY CONNECTION

Note: A standard MR411LAIR is shown. Although some of the following photos do not show this specific lifter, they all illustrate how this kind of lifter functions.

For information about specific parts, see "REPLACEMENT PARTS" and/or any separate instructions for Product Options.

# **ASSEMBLY**

- 1) Remove all shipping materials and save them with the shipping container for future use.
- 2) Adjust the <u>lift point</u> to optimize the lifter's hang angle (fig. 2A):<sup>1</sup>

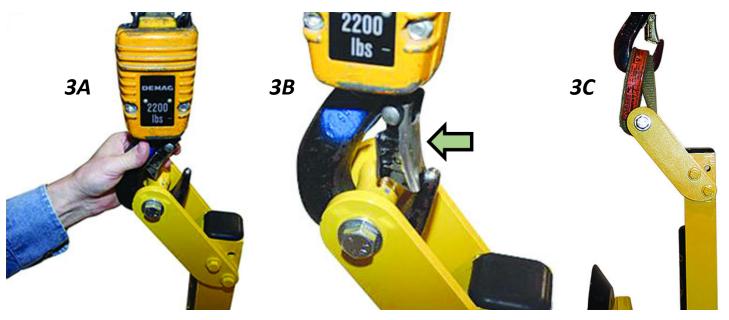

- 2.2) Move the lift point to the appropriate position.
- 2.3) Reinstall the retaining bolt and tighten both bolts securely.
- 3) Suspend the lifter from appropriate hoisting equipment:
  - 3.1) Select a crane and/or hoist rated for the Maximum Load Capacity plus the Lifter Weight.

Note: Any lifter use must comply with all statutory or regulatory standards for hoisting equipment in your region.

3.2) Attach the hoisting hook to the <u>lift</u> point (fig. 3A).

Note: Use rigging (fig. 3C) as needed to make sure the hook does not interfere with the load.

- Make sure hook has restraining latch (see arrow in fig. 3B).
- Only use rigging rated for Maximum Load Capacity plus Lifter Weight.

MR4-AIR: #35055 8 Rev 4.1/9-24

<sup>1.....</sup> Moving the lift point *forward* (away from operator) helps keep the hang angle vertical while the lifter is *loaded*; moving the lift spool *rearward* (towards operator) helps keep the hang angle vertical while the lifter is *unloaded*.

# ASSEMBLY

- 3.3) Use the hoisting equipment to remove the lifter from the shipping container. Avoid damaging the <u>vacuum pads</u>.
- 4) Remove the pad covers (fig. 4A) and save them for future use.

5) Connect the lifter to an appropriate compressed air supply at the <u>air supply connection</u> (figs. 5A-B — see Power Source under "SPECIFICATIONS"):

Note: Make sure female quick connector (supplied) is installed on the compressed air line.

This installation should be performed by qualified service personnel.

**Caution:** Make sure the air line is routed so that it does not become tangled or damaged during operation.

6) Perform tests as required under "Testing".

# INTENDED USE

### **LOAD CHARACTERISTICS**

Make sure the vacuum lifter is intended to handle each load according to these requirements:

Do NOT lift explosives, radioactive substances or other hazardous materials.

- The load weight must not exceed the Maximum Load Capacity.
- The load must be a single piece of relatively nonporous material with a flat and relatively smooth contact surface.<sup>1, 2</sup> To determine whether the load is too porous or rough, perform the "Lifter/Load Compatibility Test".
- The load's contact surface must be able to obtain a friction coefficient of 1 with the lifter's vacuum pads (see "Pad-to-Load Friction Coefficient"). Otherwise, the capacity should be derated appropriately.
- The load's surface temperature must not exceed the Operating Temperatures.<sup>3</sup>

- The load's *minimum* length and width are determined by the current Pad Spread (see "SPECIFICATIONS").
- The load's maximum length and width are determined by its allowable overhang.<sup>4</sup>
- 1" [2.5 cm] is the allowable thickness at Maximum Load Capacity.<sup>5</sup>

Note: Standard vacuum pads can stain or deform load surfaces with light colors or soft coatings. Test such surfaces for damaging effects before using the lifter on them.<sup>6</sup>

MR4-AIR: #35055 10 Rev 4.1/9-24

<sup>1.....</sup> Although concave vacuum pads can also attach to some curved loads, curvature can reduce lifting capacity. Contact WPG for more information.

<sup>2.....</sup> A "single piece" of material includes curtainwall assemblies, unitized glazing systems and similar construction units.

<sup>3.....</sup> Vacuum pads made from a heat-resistant rubber compound can enable you to lift loads with higher surface temperatures. Contact WPG or an authorized dealer for more information.

<sup>4.....</sup> The allowable overhang is the amount of load material that can extend sideways beyond the vacuum pads without breaking or otherwise being damaged. This depends on the load material, its thickness, and the angle of handling (if any). Since every material has different physical properties, the allowable overhang must be evaluated separately for each load type. Contact WPG or an authorized dealer for more information.

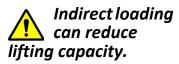

<sup>5.....</sup> However, the allowable thickness increases as load weight decreases. Contact WPG for more information.

<sup>6.....</sup> Alternative rubber compounds are available for these purposes. Contact WPG or an authorized dealer for more information.

# INTENDED USE

# **INDIRECT LOADING**

Make sure to account for dynamic loading or other inadvertent loading that can negatively affect lifting capacity, such as:

- Weight amplification that results when a loaded vacuum lifter abruptly starts/stops moving, changes direction or bounces up and down (eg, when a telehandler transports a loaded lifter across rough terrain).
- External force that effectively increases the weight of a lifter's attached load (eg, when a load of sheet material reacts to wind gusts).

### **OPERATING ENVIRONMENT**

Make sure the lifter is suitable for each work environment, given the following restrictions:

 This lifter is not intended for any environment that is dangerous to the operator or damaging to the lifter. Avoid environments containing explosives, caustic chemicals and other dangerous substances.

 The work environment is limited by the Operating Elevation and Operating Temperatures.<sup>1, 2</sup>

• The lifter is not designed to be watertight. Do not use it in rain or other unsuitable conditions.

**CE/UKCA** — A secondary positive holding device is required to lift loads on constructions sites or in other "high risk zones" (see EN 13155).

### **DISPOSAL OF THE LIFTER**

After the Service Life of the lifter has ended (see "SPECIFICATIONS"), dispose of it in compliance with all local codes and applicable regulatory standards.

Rev 4.1/9-24 11 MR4-AIR: #35055

<sup>1.....</sup> Although lifter use may be possible at higher elevation, lifting capacity is reduced whenever the lifter is unable to attain vacuum in the green range on the vacuum gauge. Contact WPG for more information.

<sup>2.....</sup> Special provisions may allow the lifter to operate outside the specified temperature range. Contact WPG for more information.

### BEFORE USING THE LIFTER

Determine whether the vacuum lifter is capable of each intended task (see "SPECIFICATIONS" and "INTENDED USE"). Then complete the following preparations:

### **Taking Safety Precautions**

 Be trained in all industry and regulatory standards for lifter operation in your region.

Read all directions and safety rules before using lifter.

Always wear appropriate personal protective equipment.

 Follow trade association guidelines about precautions needed for each load material.

### **Performing Inspections and Tests**

- Follow the "Inspection Schedule" and "Testing".
- Service the 2 <u>air filters</u> whenever a bowl contains liquid or other contaminants, or an element appears dirty (see "AIR FILTER MAINTENANCE" in SERVICE MANUAL).

Examine air filters regularly and service when needed.

# To Use Pad Shutoffs

Each <u>pad shutoff</u> on the <u>pad frame</u> controls the vacuum line to the adjacent <u>vacuum pad</u>. Activating or deactivating the airflow at specific pads enables the lifter to handle loads with different weights and dimensions (see "SPECIFICATIONS") or to avoid holes in the load surface.

To support the maximum load weight and larger load dimensions, all pads must be activated; for smaller weights and dimensions, some pads may be deactivated, *provided* that the lifter still has sufficient capacity to support the load (see "LOAD CHARACTERISTICS").

Closing any pad shutoff reduces lifting capacity.

To activate a pad, open the shutoff valve (ie, place lever *parallel* with vacuum line — fig. 1A).

To deactivate a pad, close the shutoff valve (ie, place lever perpendicular to vacuum line — fig. 1B).

Some lifter models include "on" ( $\mid$ ) and "off" ( $\bigcirc$ ) symbols for each pad shutoff: In fig. 1C, the shutoff valve's lever is placed in the "on" position, indicating the valve is open and the pad is activated.

To calculate the lifting capacity when some pads are deactivated, consult the Per-Pad Load Capacity and multiply by the number of pads currently activated. Always activate pads in a symmetrical configuration and use as many pads as possible for each load being lifted, to maximize lifting capacity and to minimize load overhang.

# TO ATTACH THE PADS TO A LOAD

### **Generating Airflow**

Place the <u>air supply switch</u> in the "on" position (| - fig. 1A).

Never place <u>air supply switch</u> in "off" position (()) while operating lifter.

Any interruption of airflow during lifter operation could result in an unintentional load release and personal injury.

### Positioning the Lifter on the Load

1) Make sure the contact surfaces of the load and <u>vacuum pads</u> are clean (fig. 1B — see "Pad Cleaning").

2) Center the <u>pad frame</u> on the load (fig. 2B).<sup>1</sup>

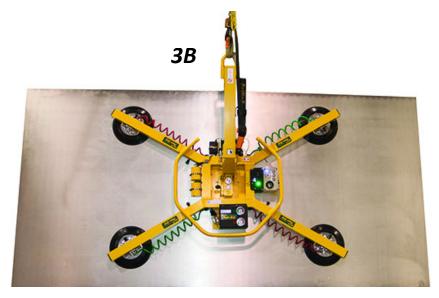

MR4-AIR: #35055 14 Rev 4.1/9-24

<sup>1.....</sup> The lifter is designed to handle the maximum load weight when the load's center of gravity is positioned within 2" [5 cm] of the pad frame's center point.

3) Make sure all vacuum pads will fit on the load and will be loaded evenly (fig. 3B).

Consult the Per-Pad Load Capacity.

4) Place the vacuum pads in contact with the load surface until they begin to seal.<sup>1</sup>

### **Reading the Vacuum Gauge**

A vacuum gauge shows the current vacuum level in positive inches of Hg and negative kPa:

- Green range (≥16" Hg [≤-54 kPa]):
   Vacuum level is sufficient to lift the maximum load weight (fig. 1C).
- Red range (<16" Hg [>-54 kPa]): Vacuum level is not sufficient to lift the maximum load weight (fig. 2C).

If it takes more than 5 seconds for the vacuum level to reach 5" Hg [-17 kPa], press on any vacuum pad that has not yet sealed.

Once the pads have sealed, the lifter should be able to maintain sufficient vacuum for lifting, except when used above the maximum Operating Elevation.<sup>2</sup> If it does not, perform the "Vacuum Test".

Rev 4.1/9-24 15 MR4-AIR: #35055

<sup>1.....</sup> Although a vacuum pad may become distorted during shipping or storage, this condition should correct itself with continued use.

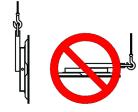

<sup>2.....</sup> If the lifter is used above the maximum Operating Elevation (see "SPECIFICATIONS"), it may not be able to maintain sufficient vacuum for lifting.

Contact WPG for more information.

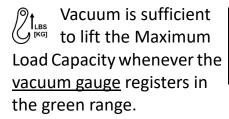

# TO LIFT AND MOVE THE LOAD

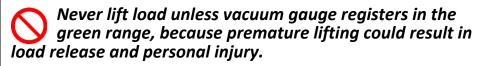

Never lift load when lifter is in horizontal orientation.

### **Interpreting the Vacuum Gauge**

When air leaks into the vacuum system, the <u>vacuum pump</u> turns on and off as necessary to maintain sufficient vacuum for lifting.

### **Monitoring the Vacuum Gauge**

Monitor the vacuum gauge (fig. 1A) throughout the entire lift.

Make sure the vacuum gauge remains completely visible.

If the vacuum gauge shows a level less than 16" Hg [greater than -54 kPa]:

- 1) Keep everyone away from a suspended load until it can be safely lowered to a stable support.
- Stay clear of any suspended load while gauge warns of insufficient vacuum.
- 2) Stop using the lifter until the cause of the vacuum loss can be identified: Conduct the "Pad Inspection" and perform the "Vacuum Test".
- 3) Correct any faults before resuming normal operation of the lifter.

### **Controlling the Lifter and Load**

When the lifter is ready, use the hoisting equipment to raise the lifter and load as needed.

Use a <u>control handle</u> (circled in fig. 1A) to keep the lifter and load in the required position.

Once there is enough clearance, you may move the load as required.

Never allow any pad shutoff to be opened or closed while lifting, because this could result in a load release and personal injury.

### In Case of a Power Failure

Although the lifter is designed to support the load for at least 5 minutes without power, this depends on many factors, including the "LOAD CHARACTERISTICS" and the condition of the <u>vacuum</u> pads (see "VACUUM PAD MAINTENANCE").

If a power failure occurs, keep everyone away from a suspended load until it can be safely lowered to a stable support. Correct any faults before resuming normal operation of the lifter.

# TO ROTATE THE LOAD

Make sure load is positioned correctly on lifter, as previously directed.

1) Make sure the load has enough clearance to rotate without contacting anyone or anything.

Keep hands and fingers away from pinch points between pad frame and lift bar.

2) Use a pad frame control handle to keep the load under control at all times.

Unbalanced loads may rotate unexpectedly when rotation latch is disengaged.

3) Pull the rotation release lever downward, to disengage the rotation latch (figs. 3A-B).

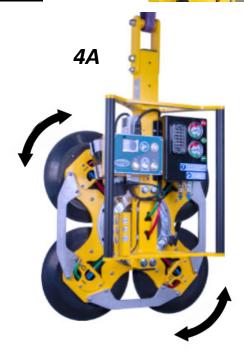

Whenever rotation is not required, keep the latch engaged.

4) Begin rotating the load (figs. 4A-B). Then, at the desired rotation stop, let go of the lever, to allow the latch to engage.

> **Caution:** Moderate the rotation speed, to avoid damaging the latch pin or rotation plate when the latch engages.

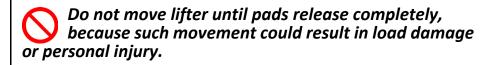

### TO RELEASE THE PADS FROM THE LOAD

Make sure load is at rest and fully supported before releasing <u>vacuum pads</u>.

1) Press the <u>"release" button</u> ((←|), to break the vacuum seal (fig. 1A).

- 2) After the load is successfully released, move the lifter away.
- 3) Before you lift another load, perform the Every-Lift Inspection (see "Inspection Schedule").

### AFTER USING THE LIFTER

- 1) Place the <u>air supply switch</u> in the "off" position ( $\bigcirc$  fig. 1B).
- 2) Use the hoisting equipment to lower the vacuum lifter gently onto a stable support. Then detach the hoisting hook from the <u>lift point</u>.

**Caution:** Do not set lifter on surfaces that could soil or damage vacuum pads.

### **Storing the Lifter**

- 1) Disconnect the compressed air supply (see "ASSEMBLY").
- 2) Use the covers supplied to keep the vacuum pads clean (fig. 1C).

**CE/UKCA** — To prevent the lifter from tipping over on relatively horizontal surfaces, place the vacuum pads facedown on a clean, smooth, flat surface. Be careful to protect the vacuum pads while tilting the lifter to the horizontal position. Then place a support under the <u>lift point</u>.

3) Store the vacuum lifter in a clean, dry location.

### **Transporting the Lifter**

Secure the lifter in the original shipping container with the original shipping materials or equivalent.

# **INSPECTION SCHEDULE**

Perform inspections according to the following frequency schedule. If any fault is found, correct it and perform the next most frequent inspection before using the vacuum lifter.

Note: If a lifter is used less than 1 day in a 2-week period, perform the Periodic Inspection before using it.

Action	Every Lift	Frequent <sup>1</sup> (every 20-40 hrs)	Periodic <sup>2</sup> (every 250-400 hrs)
Examine <u>vacuum pads</u> for contaminants or damage (see "Pad Inspection").	✓	✓	✓
Examine load surface for contaminants or debris.	✓	✓	✓
Examine controls and indicators for damage.	✓	✓	✓
Examine lifter's structure for damage.		✓	✓
Examine vacuum system for damage (including <u>vacuum</u> <u>pads</u> , fittings and hoses).		✓	✓
Examine <u>air filters</u> for conditions requiring service (see "AIR FILTER MAINTENANCE" in <u>SERVICE MANUAL</u> ).		✓	<b>✓</b>
Perform "Vacuum Test".		✓	✓
Check for unusual vibrations or noises while operating lifter.		✓	✓
<ul> <li>Examine entire lifter for evidence of:</li> <li>looseness, excessive wear or excessive corrosion</li> <li>deformation, cracks, dents to structural or functional components</li> <li>cuts in vacuum pads or hoses</li> <li>any other hazardous conditions</li> </ul>			<b>✓</b>

<sup>1.....</sup> The Frequent Inspection is also required whenever the lifter has been out of service for 1 month or more.

<sup>2.....</sup> The Periodic Inspection is also required whenever the lifter has been out of service for 1 year or more. Keep a written record of all Periodic Inspections. If necessary, return the lifter to WPG or an authorized dealer for repair (see "REGISTRATION AND LIMITED WARRANTY").

# **TESTING**

Perform the following test to determine whether or not a load surface is too porous or rough:

# Lifter/Load Compatibility Test<sup>1</sup>

- 1) Make sure the vacuum generating system is functioning correctly (see "Vacuum Test").
- 2) Thoroughly clean the load surface and the <u>vacuum pads</u> (see "Pad Cleaning").
- 3) Place the load in the upright position on a stable support.
- 4) Attach the vacuum pads to the load as previously directed.
- 5) After the vacuum level appears in the green range on the <u>vacuum gauge</u>, place the <u>air supply switch</u> in the "off" position (○).
- 6) Raise the load a minimal distance, to make sure it is supported by the lifter.

- 7) Watch the <u>vacuum gauge</u>: **Starting from a vacuum level of 16" Hg [-54 kPa], the lifter must maintain a vacuum level greater than 12" Hg [less than -41 kPa] for 5 minutes.** If not, lifting this load requires additional precautions (eg, a load sling). Contact WPG for more information.
- 8) Lower the load *after* 5 minutes or *before* the vacuum level diminishes to 12" Hg [increases to -41 kPa].

<sup>1.....</sup> The "Pad-to-Load Friction Coefficient" can affect the outcome of this test.

<sup>2.....</sup> Under CE and UKCA requirements, the lifter must maintain a vacuum level greater than 8" [less than -27 kPa].

Perform the following tests before placing the lifter in service *initially, following any repair,* when directed in the "INSPECTION SCHEDULE", or whenever necessary:

### **Operational Tests**

Test all features and functions of the lifter (see "OPERATING FEATURES" and "OPERATION").

### **Vacuum Test**

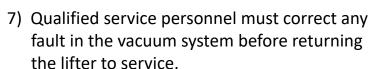

- 1) Clean the faces of the vacuum pads (see "Pad Cleaning").
- 2) Use a test load with weight equal to the Maximum Load Capacity, a clean, smooth, nonporous surface and other appropriate "LOAD CHARACTERISTICS". <sup>1</sup>

- 3) Attach the lifter to the test load as previously directed.
- 4) After the vacuum level appears in the green range on the <u>vacuum gauge</u>, raise the load a minimal distance and place the <u>air supply switch</u> in the "off" position (()).

- 5) Watch the vacuum gauge: The vacuum level should not decrease by more than 4" Hg [increase by more than 14 kPa] in 5 minutes.
- 6) Lower the load after 5 minutes or whenever a lifter fails the test, and release the load as previously directed.

This service must be performed by qualified service personnel.

MR4-AIR: #35055 22 Rev 4.1/9-24

<sup>1.....</sup> The load should have either a flat surface or no more curvature than the lifter is designed for, if any.

### Rated Load Test<sup>1</sup>

The following steps must be performed or supervised by a qualified person:<sup>2</sup>

1) Use a test load that weighs 125% (±5%) of the Maximum Load Capacity and has the appropriate "LOAD CHARACTERISTICS".

- 2) Attach the vacuum pads to the load as previously directed.
- 3) Position the load to produce the greatest stress on the lifter consistent with "INTENDED USE".
- 4) Raise the load a minimal distance and leave it suspended for 2 minutes.

- 5) Once the test is completed, lower the load for release as previously directed.
- 6) Inspect the lifter for any stress damage, and repair or replace components as necessary to successfully pass the test.

7) Prepare a written report of the test and keep it on file.

Rev 4.1/9-24 23 MR4-AIR: #35055

<sup>1.....</sup> An equivalent simulation may also be used. Contact WPG for more information.

<sup>2.....</sup> A "qualified person" has successfully demonstrated the ability to solve problems relating to the subject matter and work, either by possessing a recognized degree in an applicable field or a certificate of professional standing, or by possessing extensive knowledge, training and experience.

# MAINTENANCE

Note: Refer to SERVICE MANUAL #36112 when applicable.

### VACUUM PAD MAINTENANCE

### **Pad-to-Load Friction Coefficient**

The friction coefficient represents the lifter's ability to resist load slippage. The Maximum Load Capacity is based on a friction coefficient of 1, as determined by testing of clean, new, standard rubber vacuum pads on clean, dry, regular glass. If the lifter is used under any other conditions, a qualified person must first determine the effective lifting capacity. 1

Long-term exposure to heat, chemicals or UV light can damage vacuum pads. Replace pads every 2 years or more often when necessary.

### **Pad Inspection**

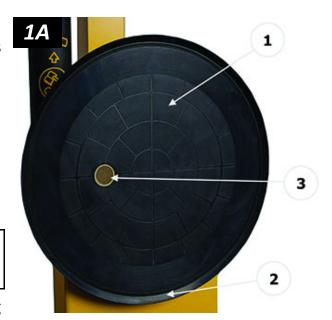

Inspect each <u>vacuum pad</u> (fig. 1A) according to the "INSPECTION SCHEDULE" and correct the following faults before using the lifter (see "REPLACEMENT PARTS", when applicable):

- Contaminants on the face (item 1 in fig. 1A) or sealing edges (item 2 in fig. 1A).
- Filter screen (item 3 in fig. 1A) missing from face.

Replace any pad that has damaged sealing edges.

- Nicks, cuts, deformation or abrasions in sealing edges.
- Wear, stiffness or glaze.

MR4-AIR: #35055 24 Rev 4.1/9-24

<sup>1.....</sup> A "qualified person" has successfully demonstrated the ability to solve problems relating to the subject matter and work, either by possessing a recognized degree in an applicable field or a certificate of professional standing, or by possessing extensive knowledge, training and experience.

# MAINTENANCE

### **Pad Cleaning**

 Regularly clean the face of each vacuum pad (fig. 1A), using soapy water or other mild cleansers to remove oil, dust and other contaminants.

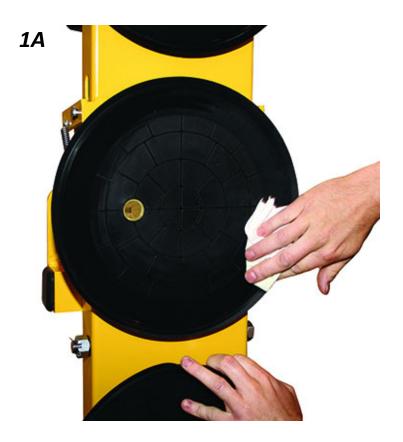

Never use harsh chemicals on vacuum pad.

Solvents, petroleum-based products (including kerosene, gasoline and diesel fuel) or other harsh chemicals can damage vacuum pads.

Never use rubber conditioners on vacuum pad.

Many rubber conditioners can leave a hazardous film on vacuum pads.

- 2) Prevent liquid from entering the vacuum system through the suction hole on the pad face.
- 3) Wipe each pad face clean, using a clean sponge or lint-free cloth to apply the cleanser.<sup>1</sup>
- 4) Allow each pad to dry completely before using the lifter.

Rev 4.1/9-24 25 MR4-AIR: #35055

<sup>1.....</sup> A brush with bristles that do not harm rubber can help remove contaminants clinging to sealing edges. If these cleaning methods are not successful, contact WPG or an authorized dealer for assistance.

# REGISTRATION AND LIMITED WARRANTY

### TO REGISTER THIS WPG PRODUCT

Go to the *PRODUCT REGISTRATION* page at wpg.com and complete the form. Registration keeps you advised of important updates and notifications, and simplifies inquiries to WPG regarding your product. Registration is *not* required to activate your Limited Warranty (see next section).

### **ABOUT THE LIMITED WARRANTY**

Note: Read the WARRANTY RETURN FORM at wpg.com for important details about the Limited Warranty.

Wood's Powr-Grip® (WPG) products are warranted to be free from defects in manufacturing and materials for 1 year from the date of purchase.

If a problem develops during the warranty period, follow the instructions below to obtain warranty service. If inspection shows that the product has a defect, WPG will repair or replace the product without charge.

### **Obtaining Warranty Service or Repair Service**

**For customers** *in the U.S. and Canada*: Go to the *EXCHANGES*, *REPAIRS*, & *WARRANTIES* page at wpg.com and click the applicable link. Alternatively, you may contact the WPG Technical Service Department (see contact information below).

**For customers** *in all other localities*: Contact the WPG Technical Service Department (see contact information below) or your dealer for assistance.
